

AI Based Product Recognition

Teachable Machine · Assignment

Thumbs Up

Rock

Stop

TOOL

Teachable Machine (Google) — a no-code tool that lets you train a custom image recognition model using your own webcam samples.

USE CASE

Trained an image model to recognize 3 hand gestures — Thumbs Up, Rock, and Stop — using real webcam samples.

OUTCOME

The model accurately identifies all 3 gestures in real time via webcam, with consistently good confidence scores across classes.

MARKETING RELEVANCE

Retailers can use image recognition to identify products on a shelf — helping marketers monitor product placement, verify promotional displays, and track stock. The same concept extends to visual search, smart retail, and personalized customer experiences. This project is a basic prototype demonstrating the underlying computer vision concept — not a claim that Teachable Machine itself is a complete marketing solution.
